

Time flies, almost the end of the program.

LA program gave me a chance to get further study and research on data analysis in education. I appreciate everything I learned and met here and the diploma it gave me. Also, I have a deeper knowledge of learning theories and more knowledge about data analysis.

As I talked with you before, Lukas, I have software development experience, now data analysis in education. 0-10 to scale my skills if 7 to be satisfied to find a job, I would say I got 5 on software development skills, 4 on data analysis skills, and 3 on learning knowledge. In conclusion, if I can not use them wisely, none of them could really help me to land a job. I have a clear understanding of my skills and situation.

I worried about it.

But emotions don't help, I need to figure out a path/solution here. Currently, I am still practicing the leetcode and I aim to strengthen my programming skills as the main foundation, then I will systematically enhance my data analysis skills and develop the ability to talk about learning theories in interviews.

In this way, I can be more focused on one direction in the future, because in my deeper mind, I like to build something significant in my limited life as a professional engineer.

But I don't have enough resources right now, so I need to work for others and learn before I could actually perform.

LA, TC, Columbia, Dr. Netriello, Dr. Liu, Dr. Hui Soo, and learning theories (Not too much data analysis tho) all took a huge influence on my career path, and I will memorize them for a lifelong time.

Honestly speaking, I don't know how my future will go, I agree education is super important and fundamental, but it's not all I want to work on. Well, I also recognize that if I have too many thoughts and lack actions, in the end, I will achieve nothing.

So finalize a direction and hard work on it. Everyone will get what they want.
