

# PTSD Outcomes Within Each Treatment Arm

1. Upload a brief description of your data set (4pt)
2. why you want to work with these data including questions that you wish to explore via graphical and tabular summaries (4 pt)
3. Include a link to where the data may be found online along with a citation in APA format.

Note that the data may not be from a textbook or a Kaggle competition.

1. PTSD outcomes within each treatment arm for Randomized Controlled Trials included in the NCPTSD's PTSD-Repository. Studies in the PTSD-Repository are categorized into six types of treatments: psychotherapy, pharmacotherapy, complementary and integrative health (CIH), nonpharmacologic biological, nonpharmacologic cognitive and collaborative care. A final category is control interventions, which are comparison conditions. The lists below each treatment category are examples of the types of treatments that fall within each category. It includes most but not all of the possible treatments.
2. The reason I choose to work with PTSD is because I think wars bring people not only victories but also costs. PTSD is the most severe medical condition for veterans. Even though there are many treatments for PTSD, the result is not all good. So I want to find out the most effective solution.

Questions:

What kind of treatments are most effective?
